

Story

Date	23 August 2026
Team ID	
Project Name	India's Agricultural Crop Production Analysis
Maximum Marks	5 Marks

By using stories in Tableau, you can effectively communicate complex data in a way that is both interactive and engaging, making it easier for the audience to follow along and understand the insights. It's a tool for **data storytelling**, allowing you to present insights in a cohesive, engaging way that takes viewers through a logical progression of findings or analyses.

In Tableau, **Story** is a feature that allows you to create a sequence of dashboards, visualizations, and text to present data insights in a cohesive and narrative-driven way. It's like a slideshow within Tableau that guides the audience through a series of data points, helping them understand key insights, trends, or outcomes of your analysis.

Observations:

- **Technology Category Leads in Profit:** The Technology category is generating the highest profit among all categories.
- **Seasonal Sales Trend:** Sales peak in November, while February sees the lowest sales, indicating a possible seasonal trend.
- **Consumer Segment Dominates:** The Consumer segment contributes to the highest percentage of sales, accounting for 50.56%.
- **Top Revenue-Generating Product:** Chairs from the Furniture category generate the highest revenue, totaling 1.66M.

Activity 2:

Publish Story on Tableau Public and Paste Public link below

[https://public.tableau.com/views/Book1_17877358352510/Story1?:language=en-USPerformance Testing:](https://public.tableau.com/views/Book1_17877358352510/Story1?:language=en-USPerformance%20Testing)

Performance Testing:

7.1 Utilization of Data filters: Data filters are used when they are required. 7.3

No of Visualization:09

8. Conclusion/Observation:

After researching on Indian agriculture, we conclude that; Indian agriculture is changing with time and agricultural yields depends upon season every year and every year the trend of seasons

is changing and we see change in seasons every year. So, we can conclude by analyzing the data that in Indian the crops should be grown in each state should be according to the environment of that state. Like Uttar Pradesh is the greatest producer of wheat so Uttar Pradesh has favorable environment for wheat production.

At the end we concluded that crops should be grown according to favorable environment and soil conditions and area of cultivation and trends of season for that particular crop in that state.

9. Future Scope: In the future, this project can be expanded to include district-level data along with state-level data. This will help in identifying areas with high and low crop production. The dashboards in future can be developed by adding crop prices and market demands. This will help us to analyze the relationship between crop production, demand, and farmers' income.

Ai will help to monitor crop diseases and faults. This can help provide early warnings so that we can prevent crops from getting damaged.
